

# TOP REASONS TO CHOOSE TRICHGUARD® FOR YOUR HERD

- **Reduce economic losses that come with a trichomoniasis outbreak.**

Protected cows are more likely to stay pregnant, reducing the financial losses that come with open cows and late-born calves.<sup>1</sup> The economic cost from having a Trich-infected bull ranges between \$2,000 and \$2,500 per animal and can impact between 25–30 percent of pregnancies, resulting in early term abortions and prolonged infertility in beef cows.<sup>2</sup>

- **Trichomoniasis isn't geographically limited anymore.**

Even though trich used to be known as a “western disease,” that’s far from reality now. With the increase in moving cattle over the years, infections have been identified in states from coast to coast.

- **You can't control everything.**

When it's breeding season, neighboring bulls don't pay attention to fence lines. Vaccinate cows to help protect your herd from shedding trich that could be introduced by cattle that aren't yours.

- **The investment in vaccination is worth it.**

Veterinary testimonials state that in neighboring herds where both are exposed to trichomoniasis during the breeding season but only one is vaccinated — a vaccination with TRICHGUARD pre-breeding can be the difference between an 80–85 percent pregnancy rate and a 60 to 70 percent pregnancy rate.\*<sup>3</sup>
